

National maritime museum

Having successfully supplied and installed Reform system installation in the Sammy Ofer wing of the National Maritime Museum in Greenwich, Protean have now provided sufficient components to complete phase 2 and trained the newly appointed team from MER to work with the system and deliver future on site installations.

The walling in this instance is clad with FR MDF and completely freestanding with additional custom elements combining with the system to complete the installation.

Reform will provide the gallery with a sustainable resource from which to deliver a programme of exhibitions including the forthcoming Royal River exhibition and ultimately help the National Maritime towards their environmental goals.
